Customer Back-Office App: High-Level Architecture Diagram

How the three parts talk to each other. Angular (frontend) → NestJS (API) → SQLite (database). Everything runs locally; login is built into the app, no cloud auth.

Login flow in 5 steps

Step 1
RM types username and password on the Login page

Step 2
Angular sends POST /auth/login to NestJS

Step 3
NestJS finds the user in SQLite and compares the password with bcrypt

Step 4
NestJS returns a signed JWT; Angular stores it

Step 5
Every customer request carries the JWT; the guard checks it before touching the database

Rule of thumb: the Angular route guard is only for user experience. The NestJS JWT guard is the real security. Passwords are stored only as bcrypt hashes.
